Analisis :

- BFS merupakan metode pencarian secara melebar sehingga mengunjungi node dari kiri ke kanan di level yang sama. Apabila semua node pada suatu level sudah dikunjungi semua, maka akan berpindah ke level selanjutnya. Dalam worst case BFS harus mempertimbangkan semua jalur (path) untuk semua node yang mungkin, maka nilai kompleksitas waktu dari BFS adalah $O(|V| + |E|)$.
- Karena Big-O dari BFS adalah $O(V+E)$ dimana V itu jumlah vertex dan E itu adalah jumlah edges maka Big-O = $O(n)$ dimana $n = v + e$
- Maka dari itu Big-Θ nya adalah $\Theta(n)$.

4. DFS

```
/*
    Nama      : Muhamad Fahrul Azimi

Analisis :

- DFS merupakan metode pencarian mendalam, yang mengunjungi semua node dari yang ter kiri lalu geser ke kanan hingga semua node dikunjungi. Kompleksitas ruang algoritma DFS adalah $O(bm)$, karena kita hanya perlu menyimpan satu buah lintasan tunggal dari akar sampai daun, ditambah dengan simpul-simpul saudara kandungnya yang belum dikembangkan.
- Big O
 Kompleksitas total DFS () adalah $(V+E)$.
 $O(n)$ dengan V = Jumlah Verteks dan E = Jumlah Edges
